WORLD BANK GROUP

Prism

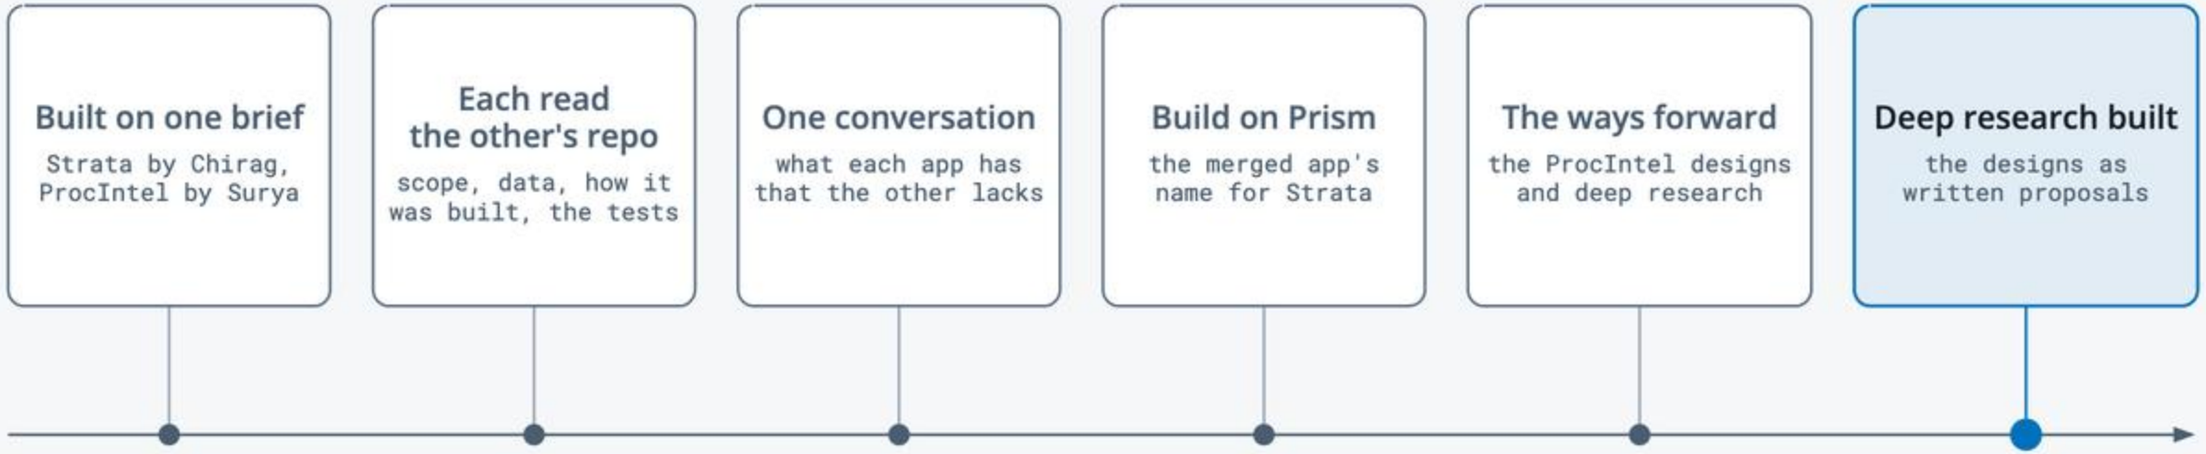

What is happening on the ground, with every sentence cited and checked

Deep research in Prism, and how we decided to build it.

Chirag Lakhanpal
Surya Yadav

We read each other's work before we wrote a line

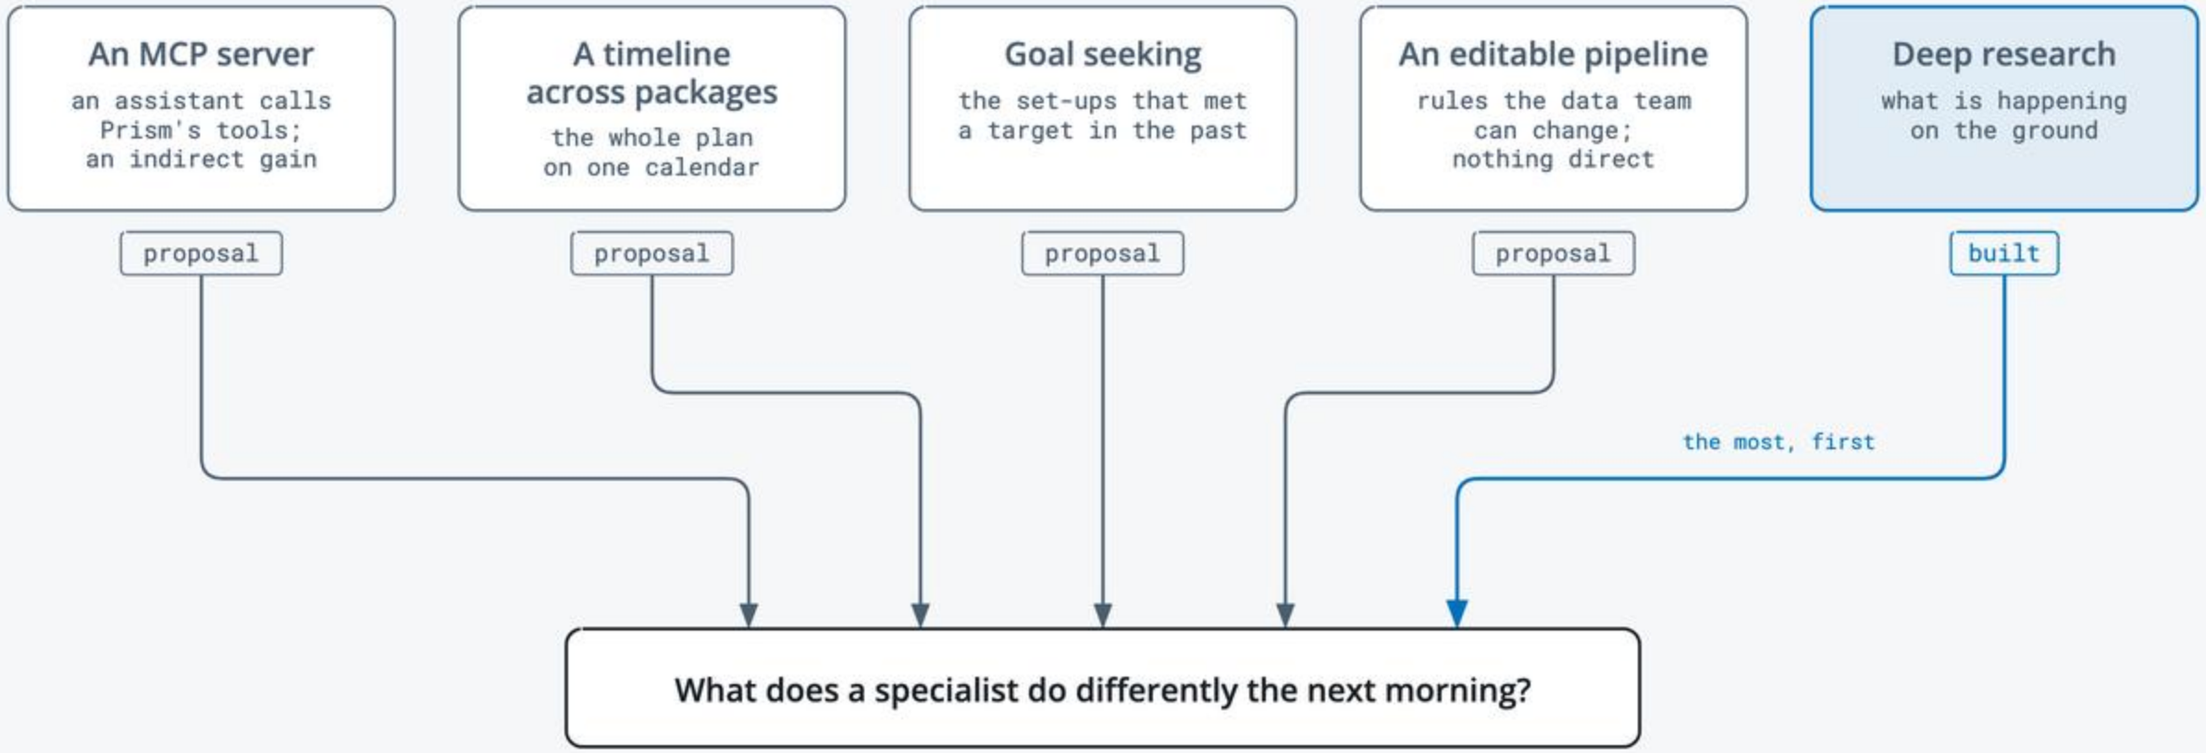

The reading came before the talking, and the talking came before any code.

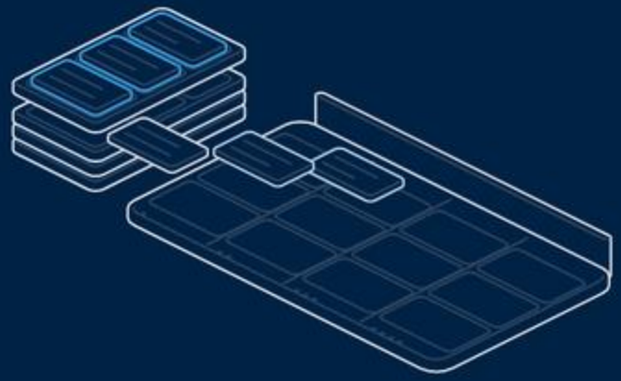

We built on Prism for its data and its checks. ProcIntel brought the sharper designs.

	Prism, then called Strata	ProcIntel
Runs on	**A Databricks lakehouse and Lakebase** a Databricks App with sign-in, a view per role, Azure OpenAI	**FastAPI and DuckDB on one machine** local llama.cpp models, a hosted front end
Data	**Every award, notice, project, rating and loan record** the World Bank publishes, and the documents of a pilot slice	**A sample of projects across many countries** and their reports
Checking	**A verifier runs the checks on every sentence** and shows what it removed	**Citations checked against the passage each cites** a refusal when the reports do not cover it
Tools	**A registry of tools** each with a verifier contract and a benchmark question	**Assess a package, ask the evidence, get a passage** list the options; served over MCP
Strengths	**A long feature list** private uploads kept to a team, every number from a tool	**An MCP server, a timeline across packages** goal seeking, an editable pipeline, all running

Prism has 61,653 lines of Python and 2,198 tests. ProcIntel has 17,766 lines and 351 tests. Both were counted the same way.

Five ways forward, one test: what does a specialist do differently the next morning?

2

Deep research

The World Bank's record moved once in a year. The ground kept moving.

Deep research is a tab on every project page. One click reads the public sources, the last two status reports and the team's field photos, then writes a short brief, checks every sentence against its source and prints it.

On the demo project the March status report put progress at 85 percent. By June the public record put the Wajir plant at 64 percent, and 7 awards landed in the last 110 days before closing.

Twelve ideas, and the question that sorted them

- A score per project, red to green. Nobody can check it, so nobody will defend it.
- A chat window over the news, or live web search by an agent. Answers that vanish, and a brief that reads differently tomorrow.
- A vision model on field photos, or a reader that pretends to be a browser. A guess with no source, and a lie to the site.
- A mood score for public posts. A mood is a number that bought posts can move.
- A daily feed of every mention. Noise a specialist would mute within a week.
- Kept for later, each waiting on one thing: a satellite change model, paid sources, translation shown beside the original, and the project's own grievance log.

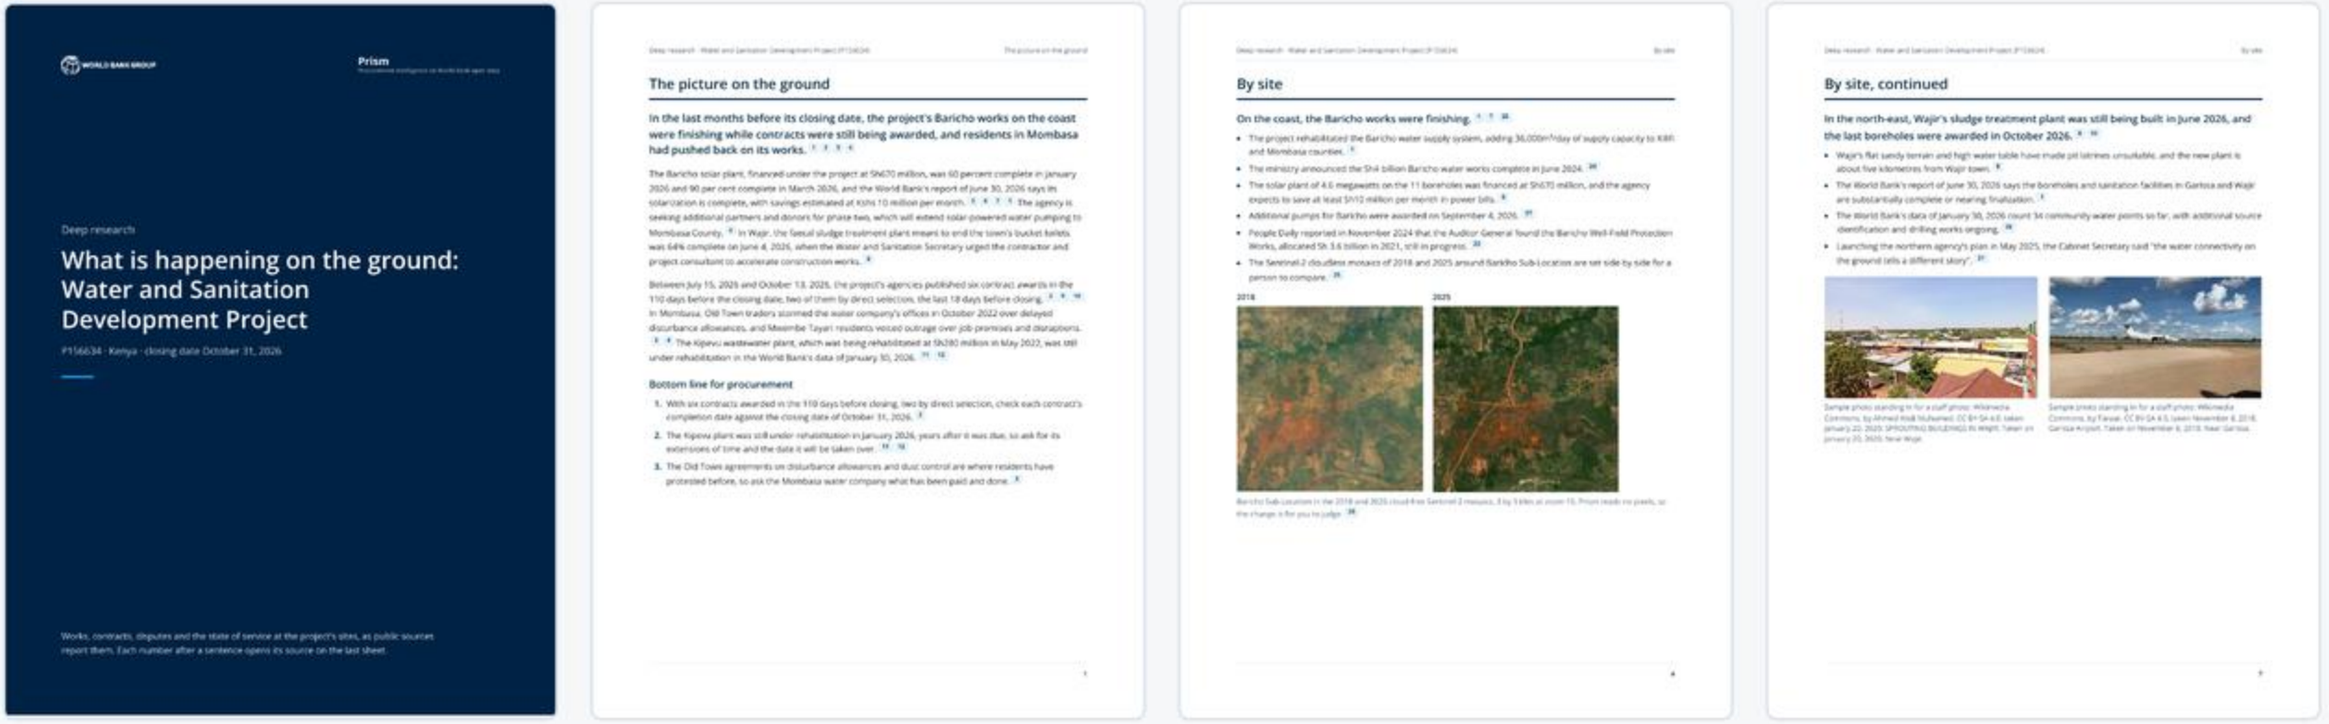

> Would a specialist act on this sentence, and defend it to the agency?

3

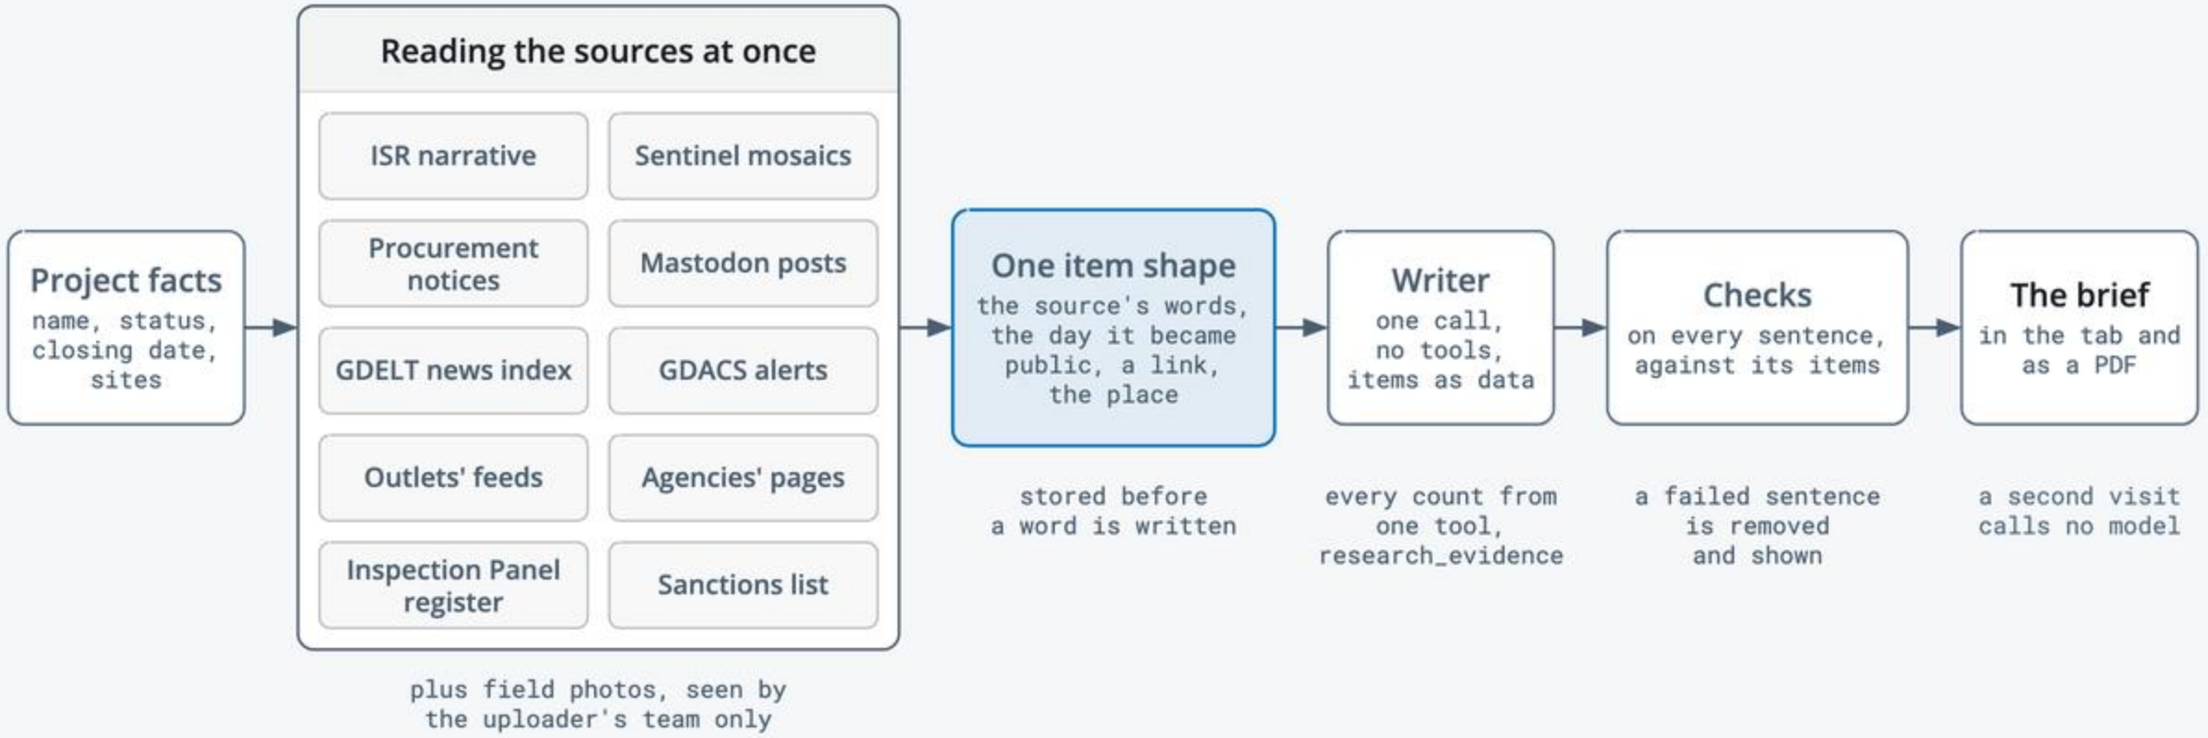

How it works

One click starts a run, and the brief that comes back can be checked line by line

The printed brief for P156634: the cover, the picture on the ground, and two By site pages, one with satellite years side by side and one with field photos.

Every source is stored as an item before a word is written, and the writer has no tools

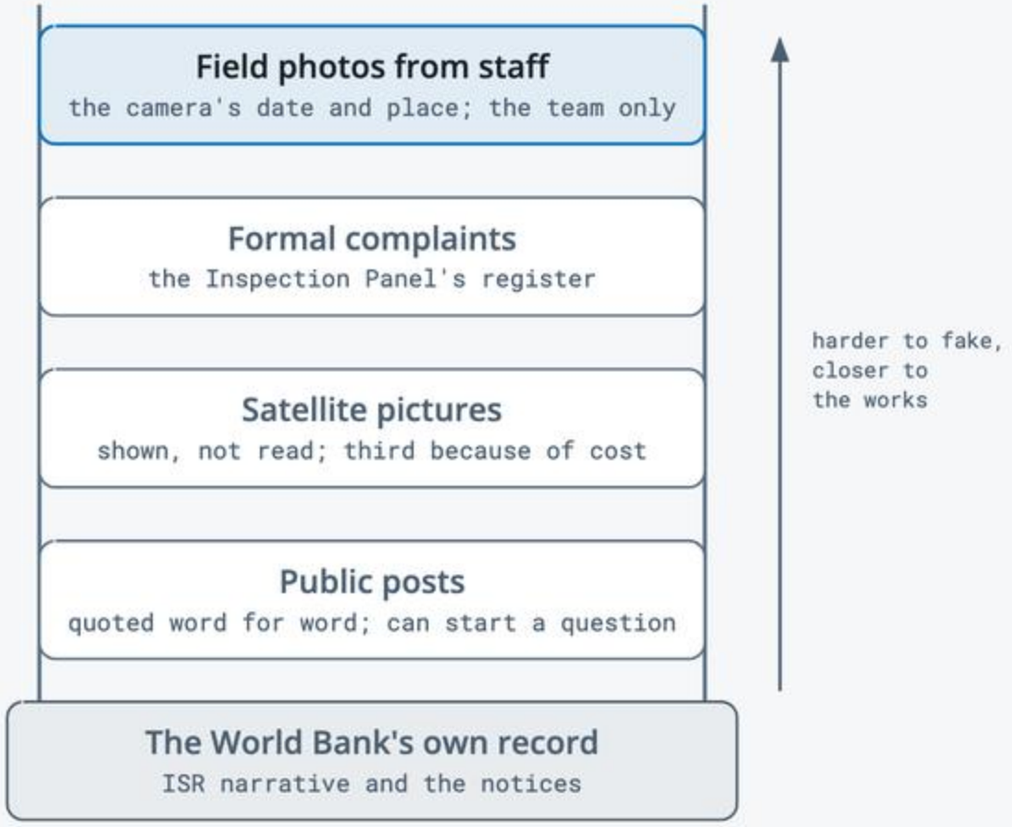

4

The decisions

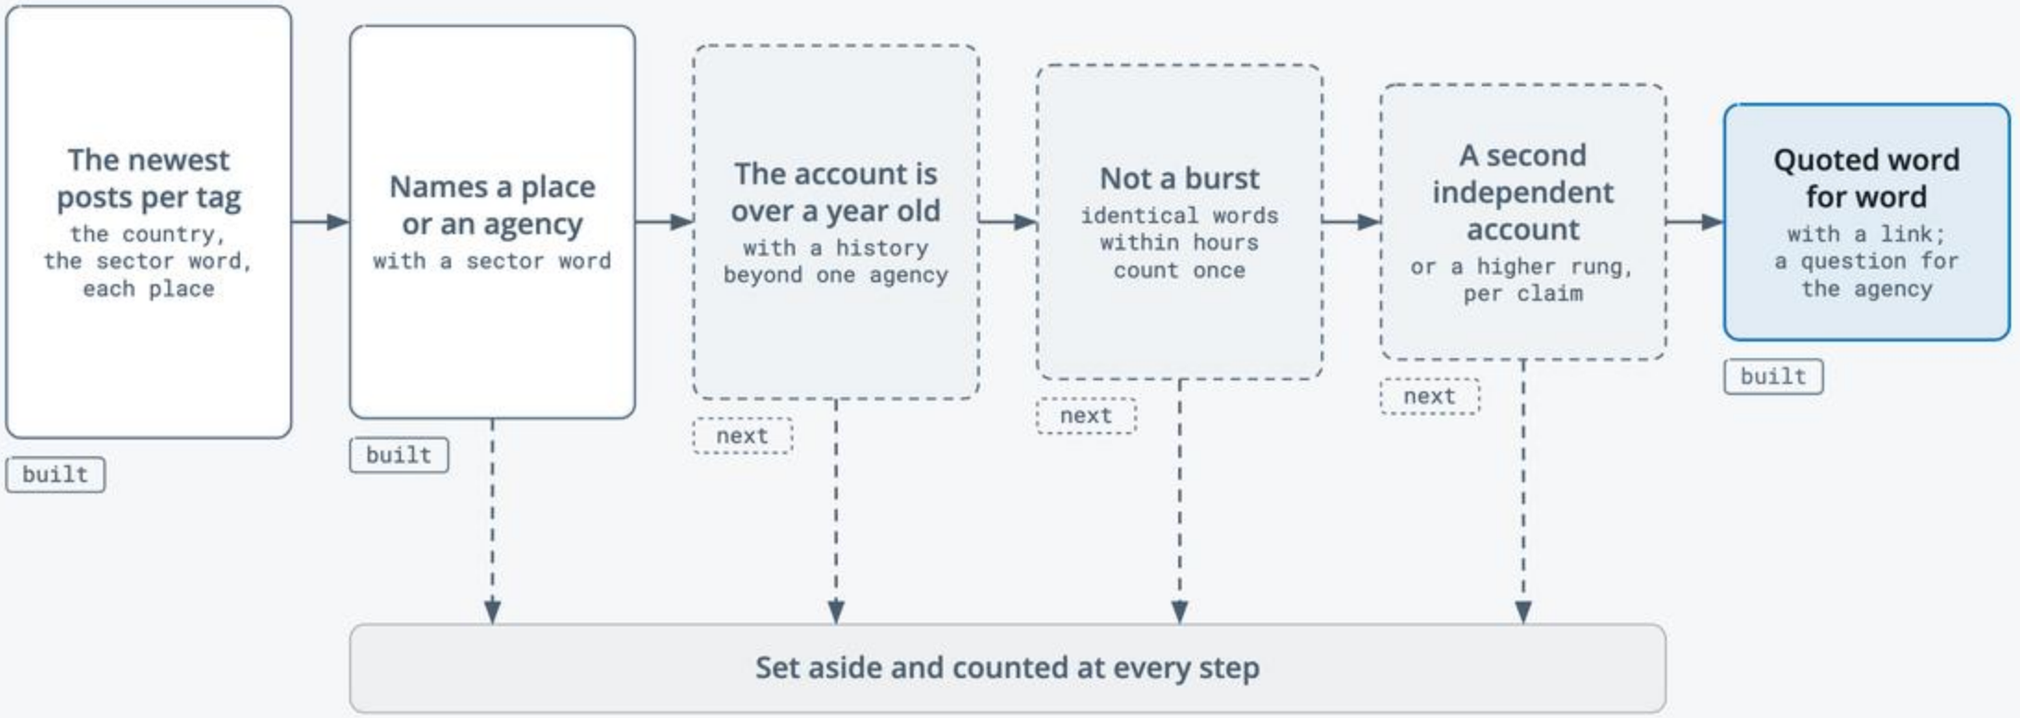

Four rungs of evidence, each harder to fake than the one below

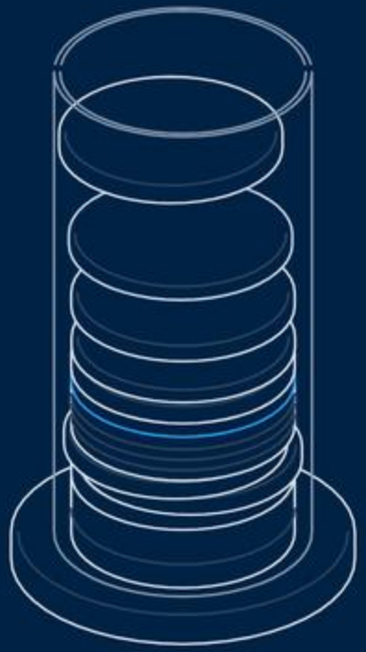

Satellite sits third because of cost. The free mosaics are yearly, at 10 metres per pixel, and show a dam but never a pipe. Prism shows the years side by side and a person judges.

A post on its own can start a question, never a finding. A claim in the picture on the ground should rest on a higher rung, or on more than one independent source. That rule is designed, not built yet.

A post is the cheapest thing to fake, so we filter at the account

Built today: a post has to name a project place or an agency with a sector word, come from a public timeline, and is quoted word for word. Designed, not yet built: the account's age and history, bursts counted once, and a burst near a bid deadline shown with its dates.

5

What comes next

Five next steps, none of them built yet

Watch a project

One cited line when a late award, a Panel case, a news item naming a site or a field photo arrives. The run exists. The watch is a schedule and a rule.

One page per supplier

Every award a firm holds, across projects and countries, and whether it is on the debarred list. Each number from the awards tool.

Check a bidding document

A team's private upload read against the Regulations and the plan: a missing clause, dates that do not add up, lots that differ.

Where the ground changed

A change model shades what moved between the satellite years. Prism points, a person judges.

The live plan inside STEP

A read-only feed of the live plan and its amendments. Amendment and rebidding risk become real signals.

Built today: the readers, the item store, the writer with no tools, the checks and the printed brief. Designed, not built: the account rules for posts, and a second source for every claim.
